1/29/2009					8.7	5.4

Conclusions

- CO and PM2.5 exhibit similar patterns to other locations in San Diego County, and the measured concentrations fall mid-range to other San Diego sites for both pollutants.
- CO levels at all monitoring sites in San Diego, including City Heights, meet all state and federal air quality standards (measured levels were well below the standards).
- CO measurements, in close proximity and on both sides of SR-15, found concentrations that were less than other areas of the County where population density, traffic, topography, and meteorology result in higher concentrations.
- City Heights is in an area with adequate ventilation and without topography for cold air to settle and trap pollutants in the surface layer. This combination of meteorology and topography contributes to good air quality in City Heights.

Conclusions (continued)

- Based upon the official FRM sampling, the 24-hour PM2.5 standard was exceeded in City Heights on two days during the study (New Year's Day and the following day, when the highest particulate concentrations are frequently measured in the County).
- City Heights had the lowest PM2.5 concentration of all monitoring sites on New Year's Day, when all sites in San Diego County exceeded the 24-hour standard.
- The PM2.5 data collected at the City Heights' locations exhibit similar patterns to other areas of the County, with concentrations in City Heights mirrored by concentrations in other locales. This indicates a strong correlation to atmospheric conditions and regional air quality patterns; not a locally-based problem.

Conclusions (concluded)

- Similar to other locations in San Diego County, the daily PM_{2.5} averages in City Heights are strongly influenced by night and morning concentrations, where atmospheric stability plays an important role in surface concentrations. During the day, when local traffic, and therefore emissions, is highest, surface concentrations tend to be at their lowest point in the diurnal cycle.
- The PM_{2.5} measurements in City Heights are consistent with longer-term measurements in other monitoring sites in San Diego County, falling mid-range between other locations. Along with the rest of San Diego County, City Heights meets the federal air quality standards for PM_{2.5}.
