FACTS ABOUT CHILD OVERWEIGHT

Overweight: Body Mass Index (BMI) at or above the 95th percentile, based on growth charts for children by sex and age, Centers for Disease Control and Prevention, 2000. BMI: It is calculated by dividing weight (in kilograms) by height (in meters) squared.

PROBLEMS ASSOCIATED WITH OVERWEIGHT CHILDREN

- 1 in 3 children born in 2000 will develop diabetes if the current trend continues.1
- 80% of people diagnosed with type 2 diabetes are overweight.2
- Risk factors for heart disease, such as high cholesterol and high blood pressure, are occurring with increased frequency in overweight children and adolescents compared to those with a healthy weight.3
- Overweight children miss significantly more days of school than healthy weight children.4,5
- Overweight children are more likely to have low scores on health-related quality-of-life questionnaires than healthy weight children.6,7
- 60% of children who were overweight at any time during the preschool period, and 80% of children who were overweight at any time during the elementary period, were overweight at age 12 years.8
- 50%-70% of overweight 10-18 year olds will become obese as adults.9
- Overweight and obesity during mid-adult life are associated with an increased risk of death.10
- $21.7 billion is the annual cost of obesity, overweight, and physical inactivity (direct and indirect medical care, workers’ compensation, and lost productivity) in California in year 2000 dollars.11

CAUSES OF CHILDHOOD OVERWEIGHT

Sub-optimal Diet:

- Only 2% of children meet national recommendations of the Food Guide Pyramid.12
- Children ages 6 to 12 consume 3.3 servings of fats and sweets but only 2.4 servings of fruits and vegetables each day.13
- 81% of high school students in San Diego Unified School District (SDUSD) reported that during the previous week, they ate fruits and vegetables less than the minimum recommendation of 5 times per day.14
- 48% of California teens eat fast food (often high in calories, fat, sugar, and salt) every day.15
- 66.3% of California teens drink at least one soda or other sweetened beverage each day,15 and consume 2-1/2 times more calories from those beverages than from milk.16

Physical Inactivity:

- Only 64.6% of high school students in SDUSD reported engaging in physical activity that made them sweat and breathe hard for 20 minutes or more on three or more days during the preceding week.14
- 38% of high school students in SDUSD said they do not attend physical education classes.14
- Children ages 2 to 18 use media, such as television, music, videos, and computers, for an average of 5 hours and 29 minutes per day.17

Lack of Environmental Support

- In urban areas, the percentage of teens who get no physical activity in a week is nearly twice as high among those without access to a safe park (14.1%) as among those with access to a safe park (7.8%).18
- Children living in activity-friendly environments are more likely to be physically active in their leisure time.19
- Fruit and vegetable intake increases significantly when there is close, easy access to supermarkets.20
- A lack of access to nutritious foods may produce obesity.21

HOW COMMON IS CHILDHOOD OVERWEIGHT?

Nationally

- In the year 2003-2004, in a representative sample, 18.8% of children ages 6 through 11 were overweight;22
- 17.4% of adolescents ages 12 through 19 were overweight.22

- In the year 2004, among the low- and moderate-income children served by the California Child Health and Disability Prevention (CHDP) Program, 14.3% of children ages 2 through 4 were overweight.23
San Diego County

- In the year 2001/2003, in a representative sample, 15.9% of adolescents ages 12 through 17 were overweight.\(^{18}\)

- In the year 2004, among the low- and moderate-income children served by CHDP, the percentage of children who were overweight is shown in the following table.\(^{23}\)

<table>
<thead>
<tr>
<th>Race/Ethnicity</th>
